

KIENE DIESEL ACCESSORIES, INC.

EUROPEAN-TYPE DIESEL INDICATOR VALVES

DESIGN FEATURES

- 250 Bar Maximum Working Pressure.
- Indicator connection accepts all common analyzers, pressure indicators, and card drawing indicators.
- Valves are manufactured with various thread configurations for installation on specific engines. Thread configurations not

shown can be manufactured to the customer's requirements.

- Kiene's 1715 and 1720 series indicator valves were developed and manufactured in Germany by Kistler/Baewert. They are designed for use on large, European diesel engines. In 2018, Kiene Diesel Accessories acquired these product lines from Kistler.

1715 SERIES INDICATOR VALVE

The forged body, hardened seating surfaces, springloaded sealing cone and large diameter spindle provide smooth action, positive sealing and a long service life. The indicator connection is in-line with the engine thread. This means convenient installation and access to indicator connection and handwheel (or hex) valve operator.

1720 SERIES INDICATOR VALVE

The indicator connection is arranged 90° to the engine thread. The hardened seating surfaces, spring-loaded sealing cone and large diameter spindle provide smooth action, positive sealing and a long service life.
