REMOTE RELEASE SYSTEMS

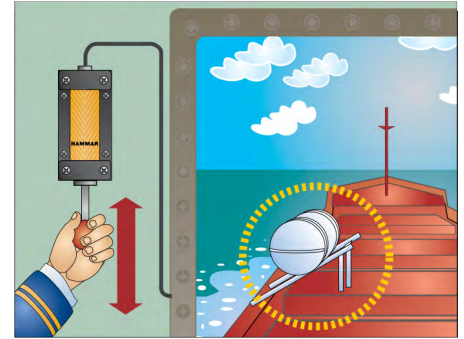

The remote release systems are designed to release heavy loads with little effort on all kinds of vessels. Two remote release systems are available:

Electronic Remote Release System (ERRS)

Via an electronic activation panel an electric remote release unit is activated, releasing a sharp stainless steel knife, which cuts a rope sling holding the object (such as a liferaft) to be released. The breaking load of the rope sling is 3750 lbs (1700 kg). The system has no limitation in installation length.

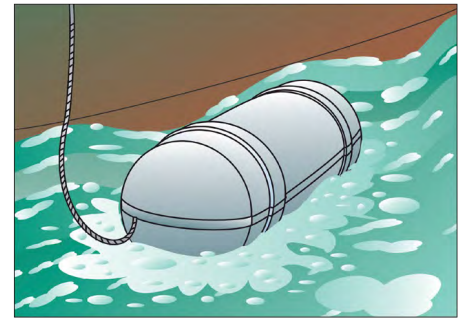

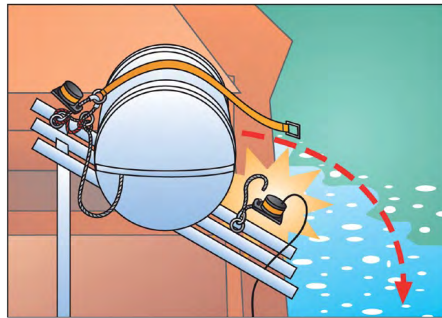

Electronic Remote Release System – ERRS.

Manual Remote Release System – MRRS.

Manual Remote Release System (MRRS)

MRRS is operated manually by means of a vacuum pump. The vacuum is conveyed via stainless steel tubing to a release unit. A membrane is activated, releasing a sharp stainless steel knife, which cuts a rope sling holding the object (such as a liferaft) to be released. The breaking load of the rope sling is 3750 lbs (1700 kg). The system is suitable for installation up to 50 metres in length.

ERRS: USCG Approval No. 160.062/2690/EC07493/F0. MRRS: USCG Approval No. 16714/160.062.

LIFEBUOY RELEASE SYSTEMS

The time it takes to launch a lifebuoy can be the difference between life and death. Most lifebuoys are installed in a holder on the bridge wing or in similar remote areas, to which access may take time. The Lifebuoy System is an easy to fit complete package for rapid launch of the lifebuoys onboard a ship.

The system consists of one Solas approved lifebuoy, which is fitted in a GRP holder. One Electric remote unit (ERU) holds the buoy in position. The ERU is activated from the bridge via an ERRS release switch. The lifebuoy is released and can save lives in a safe and quick manner.

The system is delivered with GRP-holder, ERU, release switch, connector box, cable and mounting instructions.

The Lifebuoy Release Systems can also be supplied as "Manual Only" version.

BV Attestation No: 242GTB18
